TITLE: On Chebyshev Approximation of Analytic Functions by Algebraic Polynomials (O chebyshevskom priblizhenii analiticheskikh funktsiy algebraicheskimi polinomami)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 121, Nr 2, pp 206-209 (USSR)

ABSTRACT: Joining her dissertation [Ref 2] and an earlier paper [Ref 1], the author formulates four theorems with numerous conclusions on the relations between an analytic function $f(x) = \sum_{h=1}^{\infty} \alpha_h x^h$ and the polynomial $Y_h(x)$ of at most h-th degree which approximates $f(x)$ best. Here the author considers the distribution of the deviations and the extremal polynomials and resolvents. The formulated theorems permit a determination of $Y_h(x)$ in finitely many steps according to a fixed plan. There are 3 Soviet references.

SOV/38-23-6-10/11

TITLE: Functional of the First Derivative and a More Precise Definition of A. A. Markov's Theorem

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya matematicheskaya, 1959, Vol 23, Nr 6, pp 951 - 962 (USSR)

ABSTRACT: The author starts from a former paper of A.A. Markov [Ref 1] in which it is shown that for a polynomial $P_n(x)$ from $\max_{[a,b]} |P_n(x)| = M$ it follows

$$(*) \quad \max_{[a,b]} |P'_n(x)| \leq \frac{2n^2}{b-a} M \quad .$$

For $P_n(x) = T_n(x) = \cos n \arccos (2x - 1)$ the estimation in the interior interval points is very rough. The author interprets the derivative of $P_n(x)$ as a linear functional, proves the estimation (*) by means of functional-theoretical methods and improves this estimation for the interior points

Card 1/2

Functional of the First Derivative and a More
Definition of A. A. Markov's Theorem

of the interval $[0,1]$. In these points it is

$$(10) \quad |T'_n(\xi)| = \frac{n |\sin n \theta|}{\sqrt{\xi(1-\xi)}}$$

where $\theta = \arccos(2\xi - 1)$.

A.A. Markov, V.A. Markov, Ye.I. Zolotarev and S.N. Bernshteyn
are mentioned in the paper.
There are 2 figures, and 8 Soviet references.

SOV/20-129-1-2/64

TITLE: Extremal Trigonometric Polynomials and Their Applications

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 129, Nr 1, pp 12-15 (USSR)

ABSTRACT:

$T_n(\theta) = \sum_{k=0}^n (a_k \cos k\theta + b_k \sin k\theta)$ is called an extremal polynomial if $\max |\tau_n(\theta)| = 1$ and the number of knots on $-\pi < \theta \leq \pi$ is sufficiently large. For $b_k=0$ ($a_k=0$), $T_n(\theta)$ is denoted by $C_n(\theta)$ ($S_n(\theta)$).

Theorem 1: Let $\{Q_n(x)\}$ be the set of all reduced polynomials with $\max_{[0,1]} |Q_n| = 1$ and number of knots $s > \frac{n}{2} + 1$. Let $C_n(\theta)$ have $s^* > n$ knots on $(-\pi, +\pi)$. Then

$$Q_n\left(\frac{1+\cos \theta}{2}\right) = C_n(\theta) \text{ on } [0, \pi]; C_n(-\theta) = C_n(\theta)$$

$$C_n(\arccos(2x-1)) = Q_n(x) \text{ on } [0, 1] \text{ for } 0 \leq \theta \leq \pi.$$

Let the coefficients of the polynomials $\{P_n(x)\}$ satisfy certain linear (compatible) conditions A. The determination of a polynomial of $\{P_n\}$ deviating least from zero on $[0, 1]$, and the

SOURCE: AN SSSR. Doklady. v. 159, no. 4, 1964, 715-718

TOPIC TAGS: polynomial, circuit design, antenna engineering, function theory

ABSTRACT: The design of antennas and electrical circuits uses odd algebraic polynomials with the least deviations from a constant over a finite interval. The author gives analytic methods for the construction of such polynomials using functionals. The problem is essentially to choose, from polynomials of the type

$$P_{2m+1}(x) = \sum_{k=0}^n p_k x^{2k+1},$$

one polynomial such that on $[\lambda, 1]$ for $0 < \lambda < 1$ it deviates least from $A > 0$.

Zolotarev polynomials are also discussed.

TITLE: Some indicators of the stability of functional

SOURCE: AN SSSR. Doklady, v. 161, no. 2, 1965, 270-273

TOPIC TAGS: complex variable, recursive function, functional space, functional analysis, linear functional operator

ABSTRACT: Some observations on the stability of certain linear functionals of the type $F(i), F(z), \dots, F(z^n)$, defined on the set of algebraic polynomials $P_n(x)$, are presented. Additional conditions given are that the segment of numbers composing the functional is not monotonic; real nodes through $(\delta_k)_{k=1}^{s_0}$ and loads $(\xi_k)_{k=1}^{s_0}$ are assigned to the functional, such that always $2 \leq s_0 \leq n+1$, and there are no like quantities among the δ_k and none of the ξ_k are equal to zero. The quantities

$R_n(z) = \prod_{k=1}^n (z - \delta_k)$ are defined as the resolvent of the functional and $R_{n+1}(z) = \prod_{k=1}^{n+1} (z - \delta_k)$, while the loads are determined from the simultaneous system of

Cost 1/2

L 5817-65

ACCESSION NR: AP5010151

n equations $\sum_{k=0}^n \delta_k x^k = F(x^n)$ ($m=0, 1, \dots, n$), by the formulae $\delta_m = \frac{F(R, m)}{\prod_{j=0}^{m-1} (R - \alpha_j)}$

In addition, the author defines a second system having conditional loads which, in general, is not simultaneous for $s \leq n+1$. Several consequences of the nature of the system are stated, and a theorem is given which defines a sufficient condition for consistency of the system. Four examples of functionals are tested for stability according to the criteria defined. The examples include functions of real and imaginary numbers, as well as trigonometric quantities and geometric series. Cases in which the stability criteria are not met are also demonstrated. Orig. art. has:

6 equations.

TITLE: Variation of low-frequency component of the electric-resistance oscillations of zinc in a magnetic field at a pressure of 16,000 kg/cm²

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniye, v. 2, no. 2, 1965, 67-71

TOPIC TAGS: zinc, electric resistance, high pressure research, pressure effect, transverse magnetic field, magnetoresistance, quantum oscillation

ABSTRACT: The strong influence of pressure on the frequency of the lowest-frequency quantum oscillations of the electric resistance of zinc in a transverse magnetic field, investigated earlier by one of the authors (Itskevich, with Yu. P. Gaydukov, ZhETF v. 45, 71, 1963), was studied further with the aid of a new bomb, capable of producing pressures up to 18,000 kg/cm² at helium temperatures. The new bomb is illustrated in Fig. 1 of the Enclosure. Its main advantages are that its container is self-sealing and that its moving parts are made of solid non-magnetic materials. Measurements were made without pressure and at 11,100 and 15,900 kg/cm² in fields ranging from 2000 to 11,000 oe. The results show conclu-

Card 1/3

L 083-66

ACCESSION NR: AP5021728

2

sively that the oscillations of the electric resistance of zinc decrease abruptly with increasing pressure, and are in good agreement with theoretical calculations based on the model of W. A. Harrison (Phys. Rev. v. 128, 1190, 1960). The results also confirm the existence of a needle-like electronic part of the Fermi surface of cadmium, which should become observable at the higher pressures attained in the present experiment. "The authors thank Professor L. P. Vereshchagin for continuous interest in the work." Orig. art. has: 3 figures, 1 formula, and 1 table. [02]

TITLE: High pressure (up to 18 Kbar) chamber for operation at liquid helium temperatures

SOURCE: Priory 1 tekhnika eksperimenta, no. 6, 1966, 161-164

TOPIC TAGS: high pressure chamber, metal, single crystal, liquid helium, temperature, beryllium bronze, corundum microlite

ABSTRACT: Two models of a high-pressure (up to 18 kbar) chamber used for studying single crystals of metals and semiconductors in a magnetic field at liquid helium temperatures are described. The chambers (6.5 mm inside diameter) are made of heat-treated beryllium-bronze and the pistons are made of TSM-322 corundum-microlite heat treated to a hardness of 75—78Rc. The required pressure is created in the chamber at room temperature by a hydraulic press. The chamber is then sealed mechanically and placed in a Dewar vessel containing liquid helium. Pressure is measured by means of manganin and superconducting pressure gages. The magnitudes of anisotropy

Card 1/2

UDC: 539.89

ACC NR: AP7001955

of magnetic resistance and of quantum oscillations of electric resistance of zinc, measured in the chamber, showed that the compression was close to hydrostatic. The heat expansion of the materials used for chamber construction were tested at temperatures from 77K to 20C. It was found that the heat expansion coefficient of corundum-microlite is significantly smaller than that of beryllium-bronze. Thus, using a second material in the chamber should not lead to pressure losses when the temperature drops. Orig. art. has: 4 figures and 1 table.

TITLE: Change of topology of the Fermi surface of cadmium under pressure

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniye, v. 4, no. 6, 1966, 226-230

TOPIC TAGS: cadmium, Fermi surface, pressure effect, high pressure research, resistivity, galvanomagnetic effect

ABSTRACT: This is a continuation of earlier work (ZhETF v. 45, 71, 1963) on the angular dependence $\rho(\theta)$ of the resistivity of cadmium in strong magnetic fields. The measurements were made on four samples of pure cadmium ($\alpha = \rho_{300K}/\rho_{4.2K} \approx (12 - 14) \times 10^3$) in a high-pressure chamber described elsewhere (PTE, 1967, in press). The sample axes were parallel to the $[11\bar{2}0]$ direction. The measurements have shown that at pressures above 8 kbar and $H \parallel [0001]$, an additional third maximum appears on the $\rho(\theta)$ curves, as against only two at lower pressures. The relative magnitude of this maximum is practically independent of the field intensity, but does depend on the temperature. The form of the maximum does not change when the temperature is lowered. When the pressure rose above 15 kbar, splitting of the new maximum was observed. This splitting apparently does not take place below 14 kbar, since the authors were unable

Card 1/2

L 44810-66

ACC NR: AP6032023

to resolve the new maximum by either lowering the temperature to 1.5K or varying the field between 5 and 15 kOe. This splitting suggests the possibility of saturation of $\rho(H)$ at still higher pressure. The dependence of the electric resistivity on the magnetic field intensity was measured at all pressures, with $\vec{H} \parallel [0001]$, and in the angle interval θ from -30° to $+30^\circ$ at the minima and maxima of $\rho(\theta)$. However, no appreciable change was observed compared with $\rho(H)$ at zero pressure. Nor were any electric-resistance oscillations in the magnetic field observed in this angle interval. It is suggested that the occurrence of the additional maximum, followed by the splitting, is connected with the change in the Fermi surface of cadmium and its acquisition of the same topology as zinc. The main qualitative differences between the Fermi surfaces of the two metals occur just in the plane (0001) and should be reflected in the $\rho(\theta)$ plot at $\vec{H} \parallel [0001]$. The occurrence of the maximum cannot be explained within the framework of the possible changes in the Fermi surface of cadmium. Reasons for the decrease of the resistance at $\vec{H} \parallel [0001]$ and pressures above 15 kbar and for the absence of $\rho(H)$ oscillations are discussed. The results imply the occurrence of many changes in the topology of the Fermi surface of cadmium. The authors thank Professor I. F. Vereshchagin for interest in the work, and Professor I. M. Lifshits and A. F. Barabonov for a discussion of the results. Orig. art. has: 3 figures.

TITLE: A New Type of Measuring Table for Large Scale Surveys
(Novyy tip menzuly dlya krupnomasshtabnykh s"yemok)

PERIODICAL: Geodeziya i Kartografiya, 1958, Nr 2, pp. 31 - 34 (USSR)

ABSTRACT: In order to increase the preciseness of graphic constructions on map scale tables a new type of measuring table - "measuring table with rigid support consisting of three members" (patent Nr 565539/26) is suggested here. All shortcomings of the hitherto used measuring table constructions are eliminated here. A detailed description of the measuring table follows. The measuring table weighs 11,5 kg in operational state, thus, by 4 kg less than the wooden one. If packed it weighs by 8,5 kg less than the wooden measuring table. Tests showed that it had good stability in the horizontal and vertical plane. There are 3 figures.

ABSTRACT: A simple electric device used for educational training purposes is described. The trainer-device was composed of an electric circuit with no electronic parts included. It was designed for treating 100 to 200 questions. The device consisted of a source of 3 to 6 v, five dial-type switches, 12 tumbler switches, program contact panel, five signal lights, four resistors and ammeter. The circuit was outlined in a diagram. The training operation was explained and illustrated by an example. A standard type of program panel was used for mathematical subjects. An example of such a panel was presented. Orig. art. has: 2 figures.

TITLE:

On the Diffusion of Radiogenic Argon in Sylvites

PERIODICAL:

Geokhimiya, 1959, Nr 6, pp 538 - 545 (USSR)

ABSTRACT:

The diffusion constants of radiogenic argon, the activation energy of diffusion, the electrical conductivity of frequencies of 0 - 20 megacycles and their activation energy were measured on two different types of sylvite - red and pink - of the Solikamsk deposit in the temperature range of from 20 to 700°C. The diffusion mechanism of radiogenic argon was found to differ from the conductivity mechanism and the eigendiffusion of K⁺. The activation energy of diffusion is at equal temperature higher than the activation energy of conductivity. Activation energy is not likely to decrease at low temperature (under 200°C). It is not possible to make spatial diffusion responsible for argon losses occurring in the course of geological evolution. The diffusion constant amounts to 10⁻³⁰ cm²/sec extrapolated to a temperature of 300°K. Diffusion according to pair vacancies and Schottky-defects is assumed to be the most probable diffusion mechanism. Argon losses by desorption at low temperature on one

<p>Oxidation-reduction in the liver and muscles during traumatic shock. Yu. Yu. Voronov and R. I. Lipovetskaya. <i>Méd. exp.</i> (Ukraine) 1940, No. 4, 1-7 (in Russian). <i>Med. exp.</i> (French, 8).—The arterial-venous difference in O_2 and CO_2 content, the rate of oxidation-reduction (ascorbic acid in the liver muscles (Thunberg method), the ascorbic acid content of the liver and the sugar content of the blood were measured before, after and during an ext. producing mechanical nerve stimulation and traumatic shock in dogs. Also, the ascorbic acid content of the pituitary and suprarenal glands was measured at the time of max. shock. During a severe shock caused by painful nerve stimulation, the arterial content remains unchanged, while venous decreases from 11.40 to 3.71%. In the liver oxidation-reduction is retarded, and there is an accumulation of substances of the dehydroascorbic acid type in the liver, pituitary and suprarenals. In the blood the sugar level often rises. Nerve stimulation, as well as light shock, causes acceleration of oxidation-reduction in the liver and muscles and the blood sugar also increases. The dehydroascorbic acid and related substances in the liver, pituitary and suprarenals increase in many cases, although in some their content fluctuates. The adrenaline content: as not appreciably changed after the shock. Dehydroascorbic acid was detd. by a modified Tillmans procedure: The acid was extd. from the organs along with ascorbic acid. Ascorbic acid was detd. by titration with dichlorophenol-indophenol. Then a fresh portion of the ext. was treated with H_2S in order to transform the dehydro form into ascorbic acid. The excess of H_2S was removed by a current of CO_2. Titration gave the total amount of ascorbic acid; the dehydro form was detd. by difference. C. S. S.</p>

TITLE:

Organosilicon Esters of Oximes

PERIODICAL:

Izvestiya Akademii nauk SSSR. Otdeleniye Khimicheskikh
nauk, 1960, No. 5, p. 951

TEXT: The authors report in a letter to the editor of this periodical that they had been able to prepare the trialkyl silyl ester of aldoximes and ketoximes in good yields (50-80 per cent). The synthesis was performed within 5 h at room temperature by reaction of trialkyl chlorosilanes with the corresponding oximes in the presence of pyridine according to the equation

$$R_3SiCl + HON=C\begin{matrix} R' \\ R'' \end{matrix} + C_5H_5N \rightarrow R_3SiON=C\begin{matrix} R' \\ R'' \end{matrix} + C_5H_5N.HCl.$$
 Physical constants and analytical data will be published shortly. On hydrogenation of these compounds on platinum at room temperature the O-N bond is separated. Differently substituted amines, NH_3 , and trialkyl silanols are formed.

The hydrolysis of O-triethyl-silyl-propionaldoxime by means of 5% HCl occurs only to 50-60 per cent. The initial compound, the oxime, hexaethyl-disiloxene and a resin containing nitrogen were found in the hydrolyzate. The infrared spectrum of all O-trialkyl-silyloximes contains the characteristic frequency $1636-1640\text{ cm}^{-1}$ which may probably be assigned to the valence vibrations of the C=N bond. X

TITLE:

Investigations in the Field of Alkoxy Silanes.
15. Cleavage Reaction of Hexaalkyl-disiloxanes by Means of
Phenols. New Method of Synthesizing Trialkyl Siloxy
Derivatives of Aromatic Hydrocarbons

PERIODICAL:

Zhurnal obshchey khimii, 1960, Vol. 30, No. 6, pp. 1955-1958

TEXT: In addition to a previous paper by the authors (Ref. 1) (cleavage of alkoxy-siloxanes by means of alcohols), the same cleavage reaction was attempted here by means of phenols. The phenols have a strongly acid nature, the cleavage mechanism must be electrophilic, since the disiloxanes possess an electrophilic and a nucleophilic center. According to indications in publications which are referred to, strong protonic or aprotic acids are therefore used as catalysts. The necessity of using these acids was confirmed experimentally in the present paper. The best catalysts were aromatic sulfo acids, especially benzene sulfo acid

of Aromatic Hydrocarbons

(less convenient H_2SO_4 and $ZnCl_2$). Hexamethyl disiloxane could be cleaved with phenol and its derivatives (all three isomers of cresol, p-chlorophenol, and phloroglucinol). The mono- and polytrialkyl-siloxy derivatives of the afore-mentioned aromatic compounds could thus be prepared. Six of these compounds have so far not been described. The reaction was performed in a flask with water outlet and a counter-current condenser. The mixture of 0.2 gram-mole of phenol, 1 g of catalyst, and 0.4 gram-mole of hexamethyl siloxane was boiled until water separated out, and the reaction mixture was distilled off. Yields, physical properties, and analytical data of all compounds synthesized are summarized in a table. Trimethyl siloxy-benzene was also synthesized with H_2SO_4 and $ZnCl_2$. In contrast with the 72% yields obtained with benzene sulfo acids, however, only a yield of 50 and 15%, respectively, could be obtained. All analyses were performed by Yu. N. Platonov, to whom the authors express their gratitude. The reaction scheme is assumed to be as follows:

Author : Vorontsov A.I.
Inst : Moscow Forest Engineering Institute
Title : The Biology of the Large Green Ground Beetle.
Its Use Against Forest Pests

Orig Pub : Sb. rabot po zashchite lesa. Mosk. Lesotekhn.
inot, No 1, 1957, 15-26

Abstract : The biology and ecology of the ground beetle. It destroys the caterpillars, pupae, and less frequently the eggs and butterflies of the unpaired silkworm moth, the brown-tailed moth, and other leaf-eating pests. In the unpaired silkworm moth the basic developmental stages correspond very closely to the energy with which it reacts to basic irritants. The ground beetle, however, cannot stand extremes of heat and cold; it dies in large quantities when the ground freezes

Orig Pub : Sb. rabot po zashchite lesa. Mosk. lesotekhn. in-t, fasc. 1, 1957, 46-54

Abstract : Chlorophorus varius was studied in Urde in 1953-55. The basic flight . in June up to 20 days. Females lay the eggs in small dry tubs or in wounds on branches and trunks produced by fungus diseases; they do not make incisions. In branches and small trunks not wider than 3 cm., passage of the larvae makes a few turns or loops not far from the entrance, after which it takes a longitudinal direction. The passages go
